1. INTRODUCTION

In the present paper, three original microcomputer programs are introduced. They will be found useful in the analysis of a wide variety of serial changes concerning fishery resources, such as annual or monthly changes, or serial zones of water depth (e.g. 0-19 m, 20-39 m, 40-59 m, etc.). They can also be applied for analysing catch by species of fish (in terms of weight or numbers), catch by types of fishing gear (in terms of weight of catch or number of gear units, vessels etc.) catch by fishing area, etc. The programs are applicable both for investigating the current situation in a fishery and resources and for examining changes within a given time period.

In other words, these programs can be used to analyse;

- (a) annual or monthly changes of species composition (in terms of catch in weight, or in terms of number of individuals);
- (b) annual or monthly changes of gear composition (in terms of catch in weight by different gears, or in terms of number of vessels, or total tonnage of the fleet for different types of gear);
- (c) annual or monthly changes of catch composition for different areas (in terms of the total catch, or in terms of catch of a specific species);
- (d) changes in species composition by depth (in terms of catch in weight or of catch by number of individuals);
- (e) changes in proportion of different gears used for different depth zones (in terms of the catch weight, or the number of vessels, or the total tonnage of fleet used for each type of gear), etc.

The Program No.700 is a standard one suitable for use with any of the above-mentioned analyses except monthly changes. Program No.720 is a minor modification of Program No.700, and is specially arranged for monthly changes. Program No.701 produces attachments to graphs generated by Programs 700 and 720.

The microcomputer used here is a SHARP-1500 with 8K bytes RAM module.

2. PROGRAM NO.700

(Standard program; annual changes)

2.1 Outline

This program was originally devised for the analysis of annual changes of composition by various items (e.g. species, gears, areas). In line number 10 (see Program List below), the first statement is TEST, that is a check on the depth of the four pens of the X-Y plotter. The second and third statements denote selection and setting of a pen. Line numbers from 20 to 60 are the data input, such as initial year, number of years, number of items (i.e. species, gears or areas) and data of items.

Line numbers 121 to 205 contain computation and tabulation of correlation coefficients which include a sub-program (sub-routine) of line numbers 800 to 850. Correlation coefficients in the example given here are those for 1971 (1.00), 1971-72 (0.90), 1971-73 (0.89) (see the second line of Table 1 on p. 10). Similarly the correlation coefficients are calculated for 1972 and 1971 (0.90), 1972 and 1972 (1.00), 1972-73 (0.97), etc. (see the third line of Table 1).

In mathematical expression, the correlation coefficient r between year A and B is:

$$r = \frac{\sum (X_i - \bar{X}) (Y_i - \bar{Y})}{n \delta x \delta y}$$

Where, n is number of items (see Table 2 on p. 11)

X_i is datum of item i for year A.

Y_i is datum of item i for year B.

\bar{X} is an average of data x

\bar{Y} is an average of data y

δx is a standard deviation of x , that is

$$\delta x = \frac{1}{n} \sum (X_i - \bar{X})^2$$

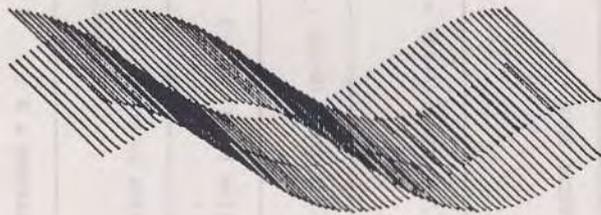

δy is a standard deviation of y , that is

$$\delta y = \frac{1}{n} \sum (Y_i - \bar{Y})^2$$

Line numbers 270 to 350 are the computation and tabulation of Table 2 and they include two sub-programs (sub-routines) of line numbers 860 to 890 (percentage) and 900 to 990 (ranking).

Line numbers 356 to 523 generate a graph of a series of correlation coefficients, with a sub-program of line numbers 1370 to 1405 (graduations on x and y axes of the graph). Line numbers 525 to 604 generate a graph of catch and include a sub-program of line numbers 1575 to 1590 (outline of curves).

When analysing changes in composition of various items by different depth zones, input "1" instead of the initial year, and the number of zones instead of the number of years (see steps 2 and 3 in Key Operation Procedure below). Then, "1" signifies the first depth zone (e.g. 0-19 m), "2" the second depth zone (e.g. 20-39 m) etc. When the computer work is finished, ***** END ***** is printed out on paper and the prompt mark ">" appears on the screen in order to confirm to the operator that the work has been completed. The statement appears in line number 608 in the Program List (see p. 16).

2.2. Key Operation Procedure (Program No. 700)

STEP	KEYSTROKE	DISPLAY (Screen)	Remarks
0	ON	>	Make sure that the prompt character ">" is on the screen; this means that the computer is ready for operation.
1	DEF	PEN SELECT (0-3) ? _	The four small boxes for pen selection are printed out on paper. After that, the computer asks the required pen number.
2	ENTER	INITIAL YEAR = ? _	If you select pen number 2, press 2 and key marked ENTER. (N.B.: the ENTER key must be pressed after every step in operation. This instruction will therefore be omitted from now on). The computer asks initial year in your data.
3	1971	No. of YEARS (6-10) = _	If initial year is 1971, type 1971. Then, computer asks number of years. If it is ten, press 10. The number of years should be between six and ten.
4	10	No. of ITEMS (6-10) ? _	The computer asks number of items. If it is eight, press 8. The number of items should be between six and ten.
5	15704	A (Itm 1, Yr. 1) = ?	The computer asks data of first item in first year. If data is 15,704, type 15704.
6	12327 (Repeat)	A (Itm 2, Yr. 1) = ? (Repeat)	The computer asks data of second item in first year. If data is 12,327, type 12327. The same procedure will be repeated until last item in the last year.
		OPERATING A B C	After input of all data, the computer starts calculation. During calculation "OPERATING A B C" is displayed on screen; where A and B denotes that the computer is presently computing correlation coefficient between year A and B, and C denotes item number which is presently computing percentage and ranking (see Tables on pages 10 and 11). Thus, the operator can see the progress of computer work. The final display in our examples is 10 10 8. After that, the computer start printing all tables and diagrams.
		OPERATING 10 10 8	
		>	When all tables and diagrams are printed out, "***** END *****" is printed out on the paper and the prompt character ">" is on the screen. The work is finished.

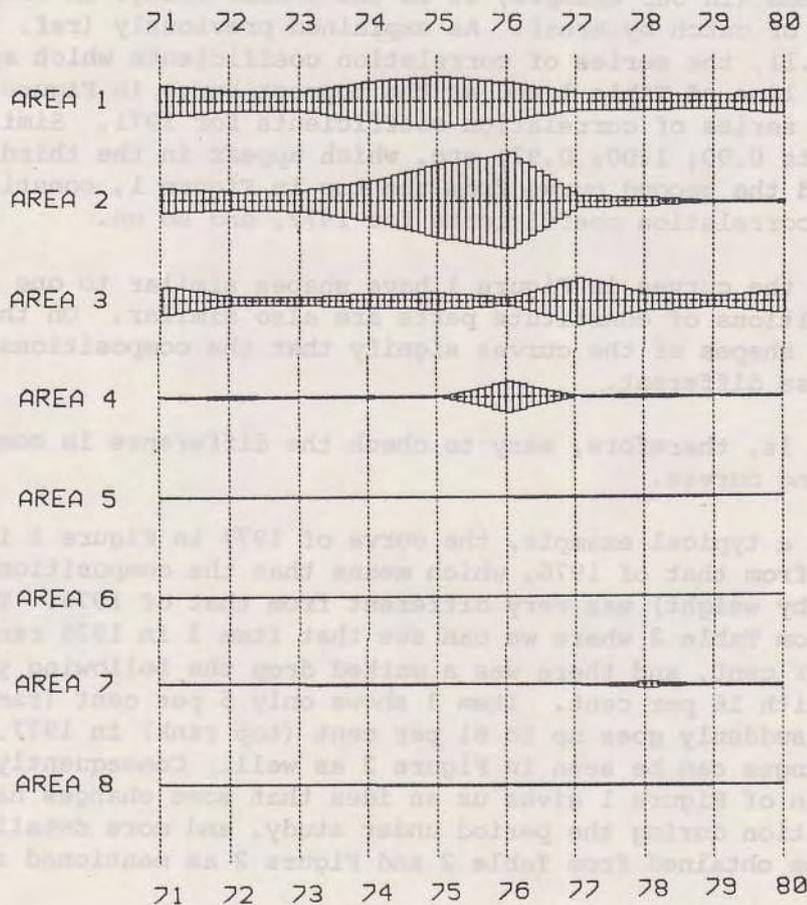

Fig. 2. Graph of annual changes of catch by Area.

2.5 Interpretation of Tables and Diagrams

A series of correlation coefficients, including the curves, is an important method for clarifying the serial changes of composition of various items (in our example, it is the annual change in composition and weight of catch by Area). As explained previously (ref. first paragraph of 2.1), the series of correlation coefficients which appear in the second line of Table 1 and as the topmost curve in Figure 1, is called the series of correlation coefficients for 1971. Similarly, coefficients 0.90; 1.00; 0.97; etc. which appear in the third line of Table 1 and the second curve from the top in Figure 1, constitute a series of correlation coefficients for 1972, and so on.

If the curves in Figure 1 have shapes similar to one another, the compositions of constitute parts are also similar. On the contrary, dissimilar shapes of the curves signify that the compositions are also more or less different.

It is, therefore, easy to check the difference in composition by examining curves.

As a typical example, the curve of 1977 in Figure 1 is very different from that of 1976, which means that the composition of catch for 1977 (by weight) was very different from that of 1976. The same emerges from Table 2 where we can see that Item 2 in 1976 ranked 1st with 55 per cent, and there was a marked drop the following year to 3rd rank with 16 per cent. Item 3 shows only 5 per cent (rank 4) in 1976, but suddenly goes up to 61 per cent (top rank) in 1977. The actual changes can be seen in Figure 2 as well. Consequently, a close examination of Figure 1 gives us an idea that some changes have occurred in composition during the period under study, and more detailed information can be obtained from Table 2 and Figure 2 as mentioned above.

3. PROGRAM No.720
(Monthly changes)

3.1 Outline

Program No.720 is a modification of Program No.700, specially arranged for monthly changes of composition of various items. As instructed in the Key Operation Procedure below (see steps 4 to 5 in the column of DISPLAY), A(1-JAN)=? is shown on the screen instead of A(Itm 1, Yr.1)=? which appeared in Program No.700. It is not necessary to input the intial month and the number of months. The words JAN, FEB, MAR,, DEC are already contained in the Program (line numbers 19 and 20). The other parts of the Program are quite similar to those of Program No.700. Therefore, no detailed explanation is necessary in this case.

3.2 Key Operation Procedure (Program No.720)

STEP	KEYSTROKE	DISPLAY (Screen)	Remarks
1	ON	>	Make sure that the prompt character ">" is on the screen; this means that the computer is ready for operation.
2	DEF A	PEN SELECT (0-3)? _	Four small boxes for pen selection are printed out on paper. If you select pen number 2, press 2. (N.B.: the ENTER key must be pressed after every step in operation. This instruction will therefore be omitted from now on).
3	2	No. of ITEMS (6-10)? _	If there are nine items in your data, press 9.
4	9	A (1 - JAN) = ?	The computer requests data of the first item in January. If your data is 21, type 21.
5	21	A (2 - JAN) = ?	Input data of the second item in January. If your data is 32, input 32. This procedure will be repeated until last item in December.
6	32 (Repeat)	A (3 - JAN) = ? (Repeat)	A sound (beep) is heard between JAN. and FEB., etc., in order to enable you to check data input.
7		*OPERATING* A MAR C.	After input of all data, the computer starts computation. During computation "*OPERATING* A JAN. C" is displayed on screen; where A and JAN denotes that the computer is presently calculating correlation coefficient between month A and March, and C denotes item number which is presently computing percentage and ranking (see Tables on page 24 and 25). The final display in our example is 12 DEC. 9.
		OPERATING 12 DEC 9 >	After that, the computer starts printing all tables and graphs. When all tables and graphs are printed out, "***** END *****" is printed out on the paper and the prompt character ">" is on the screen. The work is finished.

3.3 Printout

4. PROGRAM No.701
(Attachments)

4.1 Outline

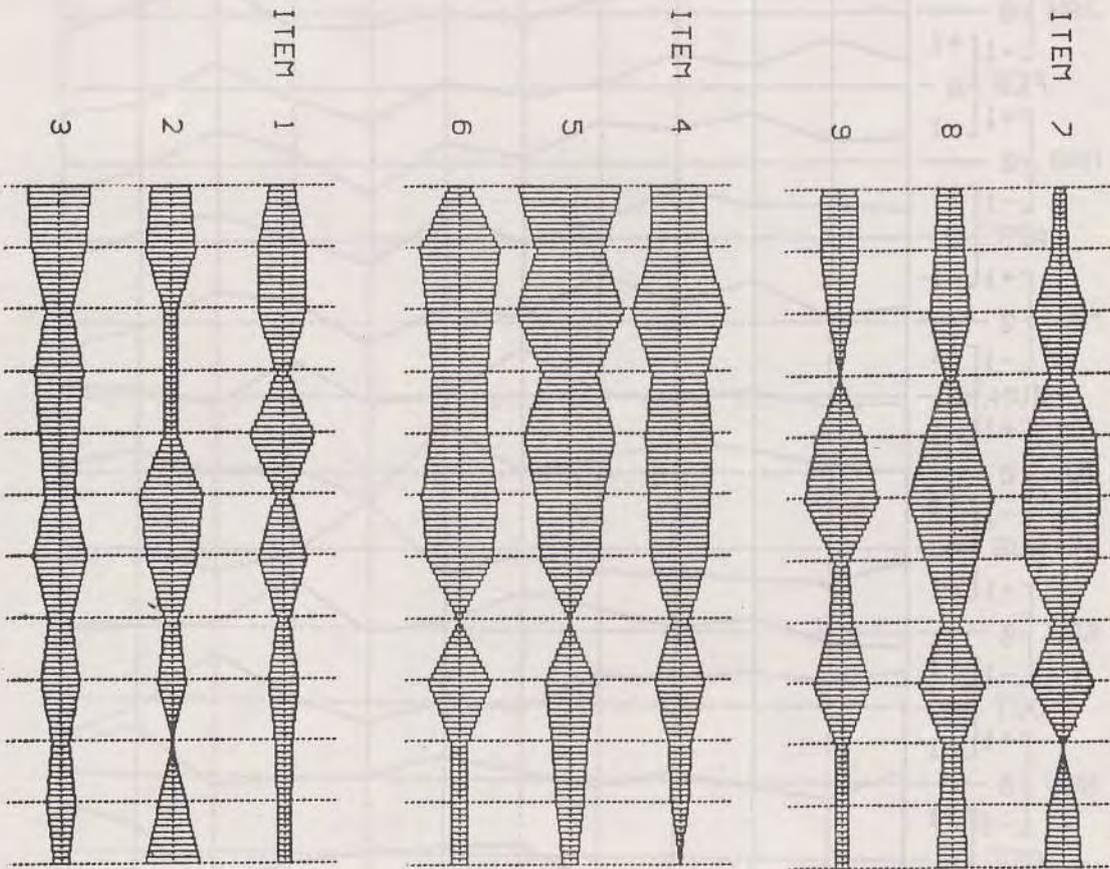

This program produces several attachments for graphs generated by Programs 700 and 720. The Program is divided into three parts; A, names of all items which are to be attached to the left side (Y-axis) of Figures 2 and 4; B, a series of chronological names (three rows) which are to be attached to the top and the bottom of Figs. 2 and 4; C, series of names of months, namely, JAN, FEB,, DEC (three rows), which are to be attached to the top and the bottom of Figs. 2 and 4. The selection of the appropriate part can be done by pushing the key marked DEF, followed by A (B or C) as explained in Key Operation Procedure below.

CORRELATION GRAPH

GRAPH of CATCH

***** END *****

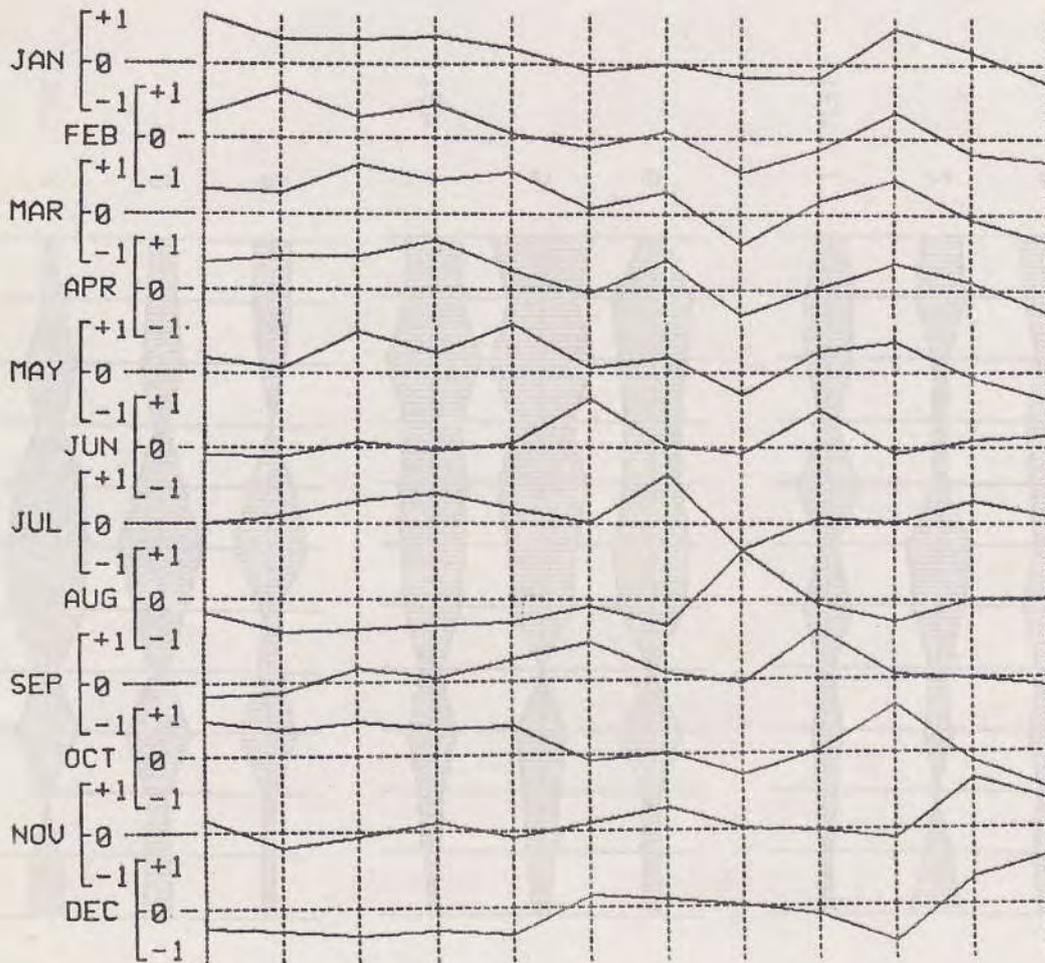

Fig. 3 Graph of curves of correlation coefficients.

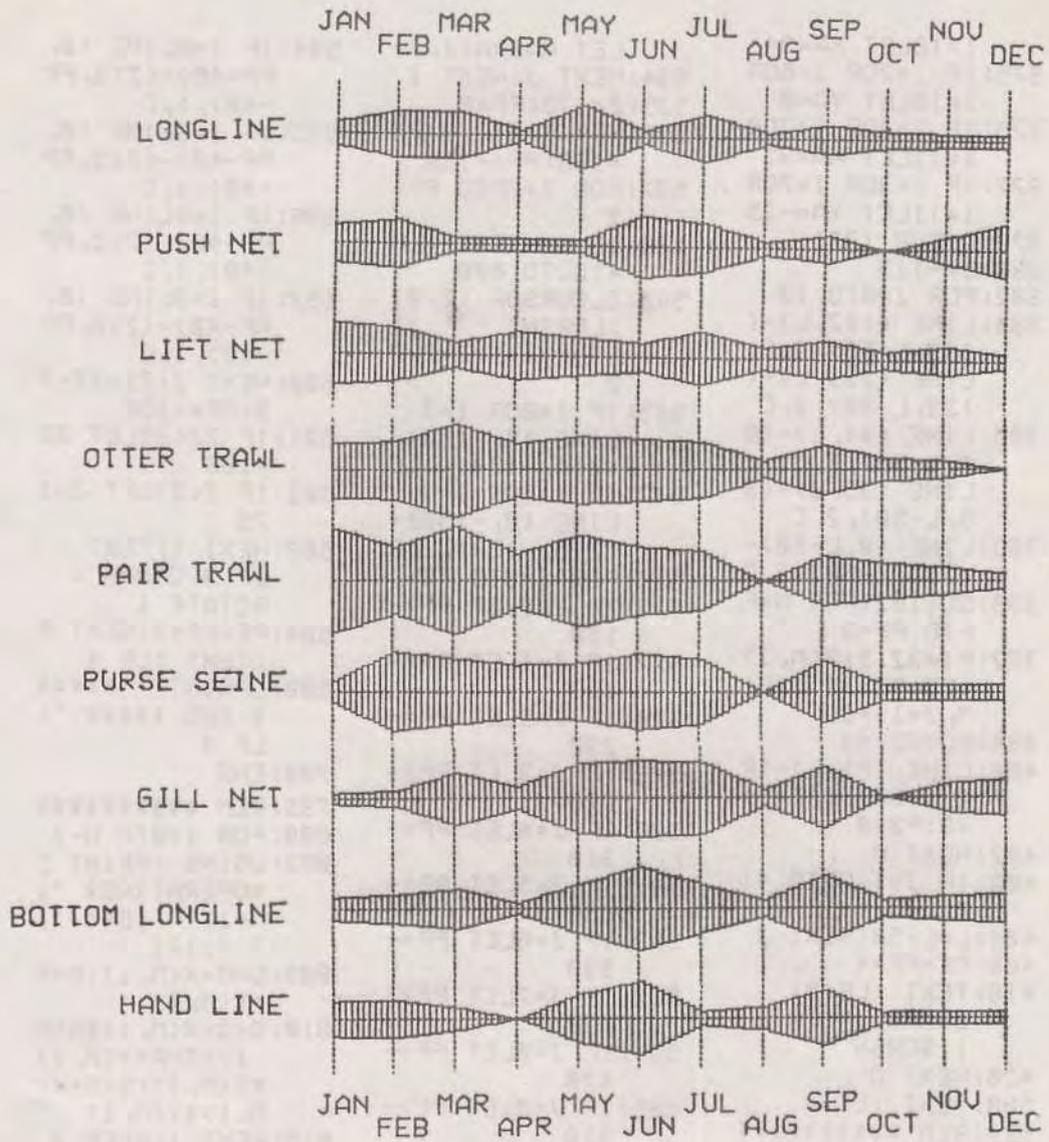

Fig. 4 Graph of monthly changes in catch by gear.

4.2 Key Operation Procedure (Program No. 701)

STEP	KEYSTROKE	DISPLAY (Screen)	Remarks
0	ON	>	Make sure that the prompt character ">" is on the screen.
1	DEF A	Number of ITEMS (6-10) = _	The computer requests the number of items. Input it by keystroke. The number of items should be between six and ten. If it is seven, press 7 and key marked ENTER. (N.B. : the ENTER key must be pressed after every step in operation. This instruction will therefore be omitted from now on).
2	7	Name of ITEM = (30 characters)	Display with sound (beep) as your reminder for about three seconds. The number of characters of each item should be 30 or less, including commas, full stops, spaces, etc.
3		Name of ITEM 1 = ?	The computer requests name of ITEM 1. Type name of first item (see Example on page 34). The computer asks name of second item. The same procedure will be repeated until name of last item. The computer starts printing.
4	OTTER TRAWL (Repeat)	Name of ITEM 2 = ? (Repeat)	
		>	The prompt character ">" is on the screen. This means that the work of sub-program A is finished.
1	DEF B	Initial year = _	The computer asks initial year in your data. If it is 1971, type 1971.
2	1971	Number of YEARS (10) = _	The computer asks number of years in your data. If it is ten, type 10.
		>	The computer prints out three rows of series of last two digits of years (1971 = 71 only). After printing, the prompt character ">" is on the screen. The work of sub-program B is finished.
1	DEF C	>	The computer generates three rows of series of names of months from JAN. to DEC. After printing, the prompt character ">" is on the screen. The work of sub-program C is finished.

4.3 Printout

Example 1. Names
of fishes.

Seriola aureovittata Plectropomus sp. TETRAODONTIAE
