## **Report of Research Activity**

### **1. Cruise Summary**

**Vessel name:** M.V.SEAFDEC 2

**Cruise no:** M.V.SEAFDEC 2 No.39-1/2012

**Period:** 14 May – 23 July 2012 (73 days)

**Area:** Waters of Vietnam

**Port of call:** Hai Phong, Da Nang, Nha Trang, Vung Tau, and Phu Quoc.

**Objective:** To carry out fisheries resources survey by using following methods:

1. Hydro-acoustic survey: Simrad EK-60 by using multi acoustic frequency (38, 120, and 200 kHz)
2. Fisheries resources sampling: bottom otter- board trawl and mid-water trawl.
3. Oceanographic survey: ICTD (including chlorophyll-A), Bongo net (Zooplankton and fish larvae), Current Indicator, and other weather information.

#### **Numbers of sampling stations and fishing gear survey:**

1. Acoustic survey: distance of the survey approximately 4,228 Nm.
2. Bottom and mid-water trawl: totally 115 stations, including 80 stations for bottom trawl, and 35 stations for mid-water trawl (to be decided by the chief scientist of RIMF during the survey)
3. Oceanographic and plankton survey: approximately 120 stations will be carried out

## 2. List of personal on board

### 2.1 Ship personals

No.	Name	Position
1.	Mr. Tossaporn Sukhapindha	Captain
2.	Mr. Nanthawat Phungsuk	Chief Engineer
3.	Mr. Suren Pruksarat	Second Officer
4.	Mr. Vudhirat Vudthipanyo	Third Officer
5.	Mr. Padung Ngowlimhuat	Second Engineer
6.	Mr. Kittinai Sukdit	Third Engineer
7.	Mr. Tana Rungjoy	Boatswain
8.	Mr. Pradit Kui-prasert	Steersman
9.	Mr. Charan Intippunya	Steersman
10.	Mr. Chainarong Chopaknam	Fishing assistant
11.	Mr. Somyos Pronprasert	Fishing assistant
12.	Mr. Boontarin Wora-in	Fitter
13.	Mr. Plew Shodok	Oiler
14.	Mr. Teeradet Jantana	Oiler
15.	Mr. Akarapol Chaibanyat	Oiler
16.	Mr. Saichol Kornnoom	Cook
17.	Mr. Marut Sangphuek	Ship's Boy

### 2.2 Researchers from SEAFDEC/TD

No	Name	Responsibility	Contact address	Period of duty
1	Mr. Isara chanrajkiij	Chief scientist	<a href="mailto:Isara@seafdec.org">Isara@seafdec.org</a>	20 May - 20 July
2	Mr. Sayan Promjinda	Fishing gear Technologist	<a href="mailto:sayan@seafdec.org">sayan@seafdec.org</a>	20 May - 20 July
3	Mr. Narong Ruangsivakul	Fishing gear Technologist	<a href="mailto:narong@seafdec.org">narong@seafdec.org</a>	20 May – 29 June
5	Dr. Natinee Sukramongkol	Fisheries Oceanographer	<a href="mailto:nattinee@seafdec.org">nattinee@seafdec.org</a>	20 May – 19 June

### 2.3 Vietnamese national researchers

No	Name	Responsibility	Contact address	Period of duty
1	Mr. Nguyen Viet Nghia	Coordinator/RIMF	<a href="mailto:nvnghia@rimf.org.vn">nvnghia@rimf.org.vn</a>	24 May-3 Jun
2	Mr. Vu Viet Ha	Coordinator/RIMF	<a href="mailto:vvha@rimf.org.vn">vvha@rimf.org.vn</a>	4 - 11 Jun

18	Mr. Vu Van Tam	Observer/DOF		30 Jun-10 Jul

### 3. Report in General

M.V. SEAFDEC Cruise No.39-1/2012 is a collaborative research survey between Research Institute of Marine Fisheries, Vietnam (RIMF) and Southeast Asian Fisheries Development Center (SEAFDEC), to investigate status and stock of small pelagic fisheries resources in Vietnam Waters. Cruise survey is scheduled from 26 May to 18 July 2012, by dividing into 5 sub-trips.

Respecting to Cruise Order M.V. SEAFDEC2 Cruise No.39-1/2012, forty-five (45) hydroacoustic tracks and a hundred twenty (120) oceanographic survey stations (OS) have been detailed to collect larvae and plankton by using Bongo net and environment parameters are collected by CTD, are conducted during trip. Small pelagic resources sampling by trawls do not position into the plan but be able to conduct in referring to fish school showed by echo trace of hydroacoustic equipments. It is, however, the method found inapplicable for survey operating because rarely fish school found during survey. Small pelagic resources sampling is modified to operate along the hydroacoustic tracks.

Prior the survey is launched, the calibration of hydroacoustic equipment (Simrad EK-60) and pelagic trawl fishing trial, is carried out on 24 and 25 May 2012 in vicinity of Halong Bay. Area of calibration is not so suitable in regarding to current condition however calibration is accomplished without pelagic trawl fishing trial operation.

The first sub-trip is carried out from 26 May to 2 June 2012. Area of survey is around Gulf of Tong Kin. Two (2) ports, Hai Phong and Da Nang are defined as Port of Calls. Total numbers of oceanographic survey stations are thirty two (32) stations and number of bottom trawl fishing is eighteen (18). Few fishing positions are selected to conduct on the hydroacoustic track. Thirteen (13) hydroacoustic tracks are carried out the recording by hydroacoustic survey equipment (Simrad EK-60). Fishing gear is switched from Bottom trawl to mid-water trawl for fishing trial after finishing oceanographic survey station OS26, at Con Co Island. Mid-water trawl fishing trial, however, is cancelled because net drum is trouble by insufficient pulling power. M.V. SEAFDEC2 proceeds to port of Da Nang for repair net drum. Weather and sea condition during the trip is generally slight during sub-trip.

The second sub-trip is carried out from 5 to 10 June 2012. Area of survey is around central part of Vietnam Water. Port of call is Nha Trang. Total numbers Oceanographic survey station area Sixteen (16), and seven (7) mid-water trawl fishing operation and one (1) mid-water trawl trial operation is carried out during sub-trip. At trawl fishing station No.5, mid-water trawl net is damage from accident of over trawling depth layer and net struggled with rough sea bottom. Crews spend a day replacing ground rope and net mending. Six (6) hydroacoustic tracks are carried out the resources abundance information recording by hydroacoustic survey equipment (Simrad EK-60). During the hydroacoustic survey from OS 45 to OS 46, M.V. SEAFDEC2 get the accident of electricity trouble. It causes main supply of 24 voltages electric system is blackout and GPS system includes with GPS data transfer system is collapsed. Gyrocompass was consequently trouble and autopilot system is failure. All research activities are cancelled after finish OS45, among hydroacoustic track No. 20 (Waypoint No.19 to Waypoint No.21). M.V. SEAFDEC2 is preceded to Port of Nha Trang manually. Weather and sea condition during the trip is generally slight however the sea condition turns to moderate in particular afternoon time after the day 7<sup>th</sup>.

The third sub-trip is carried out from 20 to 28 June 2012. Due to the electricity and navigation instruments malfunctioning, M.V. SEAFDEC2 spends 10 days to partly repair. Area of survey

is around central part of Vietnam Water. Port of call is Vung Tao. Total numbers Oceanographic survey station area Twenty four (24), and five (5) mid-water trawl fishing operations, are carried out during sub-trip. Eleven (11) hydroacoustic tracks are carried out abundance of fisheries resources information recording by using hydroacoustic survey equipment (Simrad EK-60). Regarding that rough sea and bad weather condition causes mid-water trawl fishing is not able to fully operate and echo signals of hydroacoustic equipment (Simrad EK-60) show very rare fish school as well as signal is very poor quality and during the track southwestward while ship is navigated against wind direction. Result of catch is unsatisfied.

The forth sub-trip is carried out from 2 to 9 July 2012. Port of call is Phu Quoc Island. Area of survey is around southern part of Vietnam Water, Eastern of Gulf of Thailand. Total numbers oceanographic survey station area twenty three (23) and sixteen (16) bottom trawl fishing operations are carried out during sub-trip. Bottom trawl fishing operations are designed to conduct few operations along the hydroacoustic track. Fishing operation No.22 on hydroacoustic track No.31 is trouble during shooting net. Otter board is struggled with sea bottom and trawl net is broken. Crews spend 5 hours to repair and fishing operation is able to conduct in the following days. Weather and sea condition during the trip is generally moderate but found the slight condition during morning period.

The fifth trip sub-trip is carried out from 11 to 18 July 2012. Port of call is Vung Tau. Area of survey is around southwestern part of Vietnam Water, Eastern of Gulf of Thailand. Total numbers oceanographic survey station area twenty four (24) and twenty one (21) bottom trawl fishing operations are carried out during sub-trip. Eleven(11) acoustic tracks of resources abundance information recorded by hydroacoustic equipment (Simrad EK-60) are conducted during this sub-trip. During hydroacoustic waypoint No.37-38, two petroleum platforms are obstructed the route so that M.V.SEAFFDEC2 must adjust the course for safety navigation and fishing operation on this track is adjusted to 10 nautical mile away from original acoustic track. Observation that many stationary gears i.e. fyke net, stake trap was found along the coastal in shallow water. It is dangerous for navigation in the nighttime and oceanographic survey operations. The area of fifth sub-trip found many type of stationary fishing gears in particular bottom gillnet, longline-trap, longline-hook what also obstructed the trawl fishing operation Many trawlers both pair trawls and single trawls are observed around the deeper area.

Overall result from five survey trips are one hundred and twenty one (121) oceanographic survey operations by CTD, Bongo net, and Neuston net. Fifty seven (57) fishing operations are conducted the demersal resources survey by otter-board trawl. Twelve (12) mid-water trawl fishing operations are conducted and forty four (44) hydroacoustic tracks, approximately 4,200 nm is recorded of fisheries resource abundance by hydroacoustic equipment (Simrad EK-60). The map of survey station was show in (Fig.1)

The general observation from cruise survey is concluded that;

1) Trawl net should be modified for more research performance. Bottom trawl net is 3-5 m. net height that is not sufficient to catch small pelagic fish sometime observe at depth 10 m above sea bottom. New high opening design is need to investigate and installed with M.V.SEAFFDEC2 for the next survey

2) Mid-water trawl installed onboard M.V.SEAFFDEC2 is commercial scale design. It is too large to operate by less experience crews. The original net opening is record as 20-30 m. but the operation is found inconvenient with heavy weight. Operator remove the weight and found opening is 10-15 m what suitable to operated in shallow area. The minimum sea depth is 40 m. Modification of mid-water trawl net for more convenient for operation e.g. reduce scale of net, change some lighter weight material should be priority carried out.

3) Otter board for using both bottom trawl and mid water trawl net should replace conventional otter board. Nowadays fishers in Northern Europe and Alaska, USA has introduced the hybrid otter board what be able to operate both bottom trawl and mid-water trawl. Only otter board allows M.V.SEAFFDEC2 switch of the net during operated and reduce dangerous during changing otter board.

4) Net Sonde is the depth sensor used for this cruise. The accuracy is found error at the depth less than 20 m. As well as trawl eyes sensor and wing net sensor found malfunction. It is very important to prepare the new more accuracy net recorder and sending trawl eye sensor and wing net sensor to maintenance and check at the factory.

5) Weather condition is one of the major hindrances affected to fishing operations during the cruise survey. Wind force level 5 makes trouble the vessel maneuvering and get harm to deck crew. It is found that ship drifting more than 2 nm/hr while wind force 5. That is

impossible for setting the net because speed of vessel during shooting net cannot be controlled. If shooting operation is success, strong wind directly affects to towing speed both follow wind and against wind direction.

6) Local fishing boats and activities always make trouble to research survey. It is not only fishing operation but also hydroacoustic Survey. Area Gulf of Tong kin southerly, surface gillnet target on flying fish always obstructs to hydroacoustic tracks. There are many fishers conducted gillnet trap and longline at the central part of Vietnam Water. They always obstructs to trawling track and make fishing operation towing time is shorter that standard operation.

7) Oceanographic survey is collected by instrument of RIMF Vietnam. Obviously that it is not priority of SEAFDEC oceanographer to participate with cruise survey.

8) Some petroleum platforms obstructed the hydroacoustic tracks of sub-trip 3 and 5. It is very important for safety operation to inform these platforms to acknowledge task of M.V.SEAFDEC2.

Results of catches, however, are not report as a part of fishing log. Data is available under the approval by RIMF, Vietnam. Anyone who requires and interested in the result of catch, contact to the survey project coordinator, Mr. Nguyen Viet Nghia, Research Institute for Marine Fisheries-Vietnam (RIMF). Address: 224 Le Lai street, Hai Phong city, Vietnam. [Tel:+84 313836656](tel:+84313836656) , Fax:+84 313-836812; [www.rimf.org.vn](http://www.rimf.org.vn)

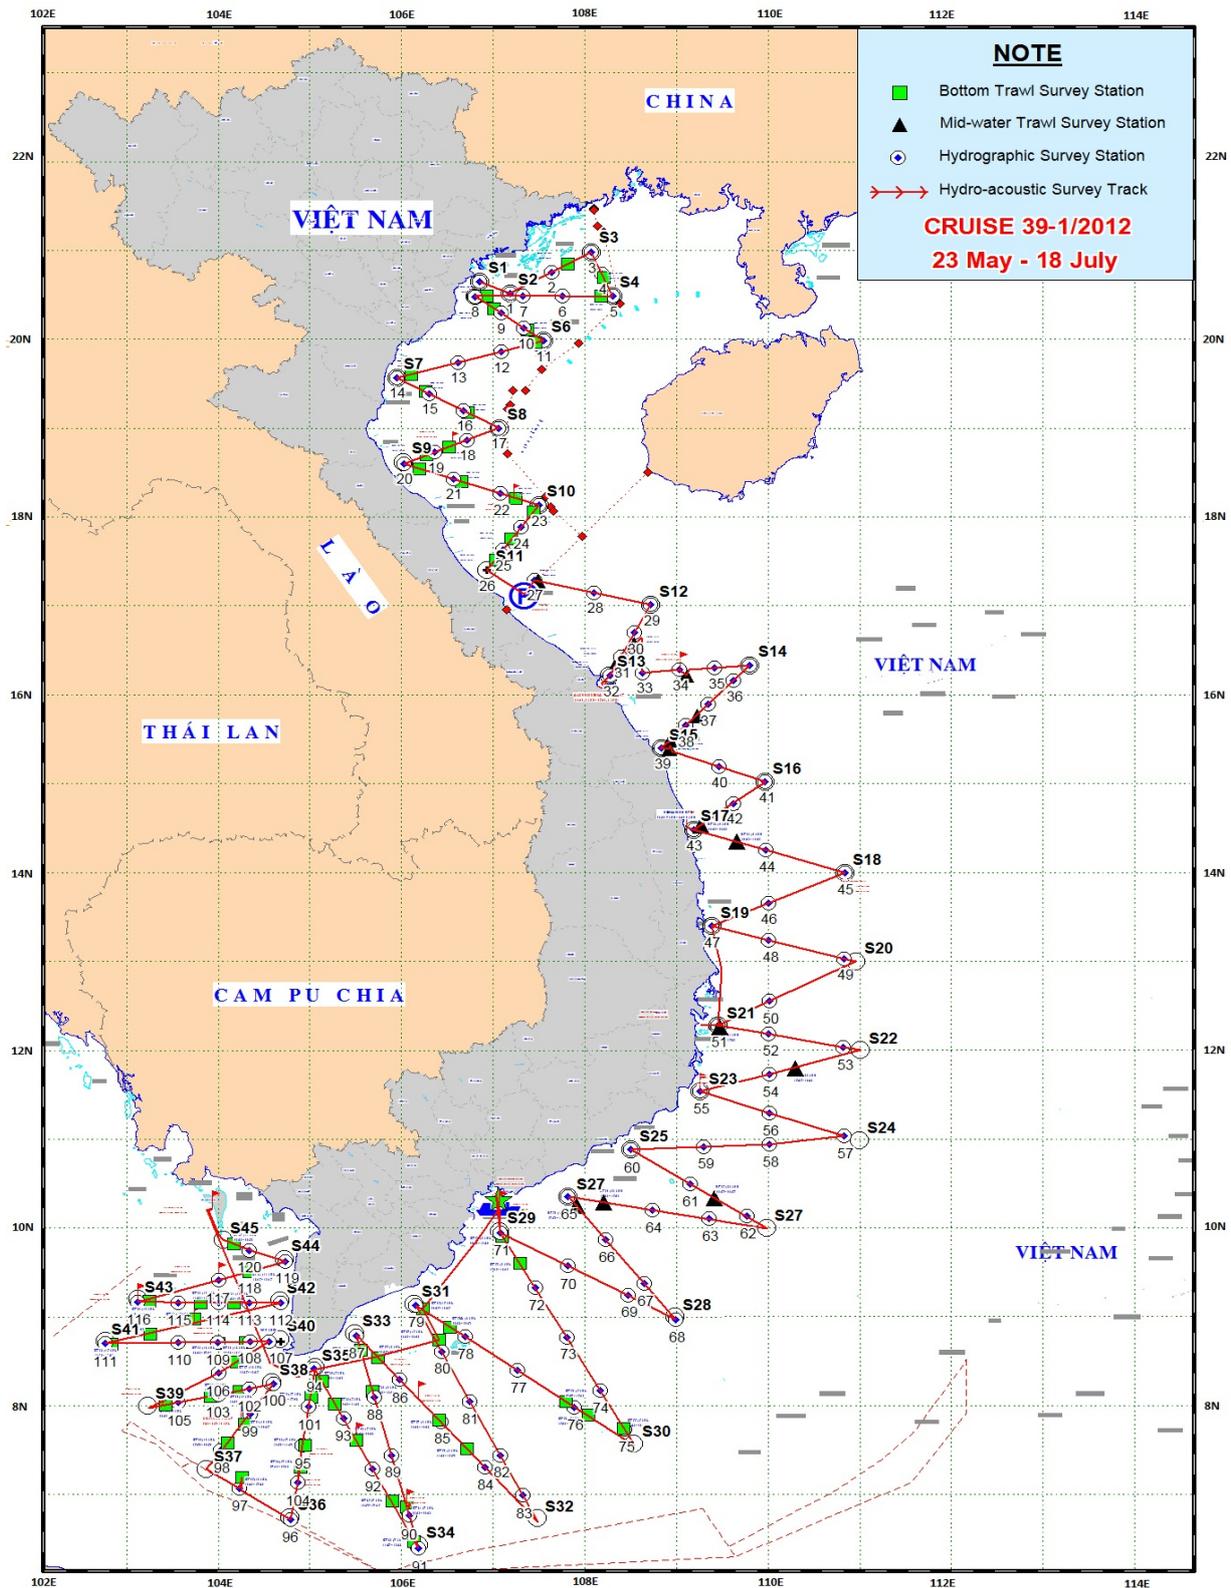

Fig. 1 Map showing the survey stations

## 6. Oceanographic survey

### 6.1 Physical and biological oceanography

There were 121 oceanographic stations completed during 26 May to 18 July 2012 (Figure 1). Physical and chemical characteristics of water were collected using compact CTD data logger (ASTD-151), compact-EM (current meter), and Thermo-Salino Graph. The compact CTD were deployed the same time with current meter from the sea surface to the maximum depth of approximately 250 meter (Figure 2). The general information during the cruise tracks such as; ship position, weather and sea condition were record every hour through the navigation deck unit.

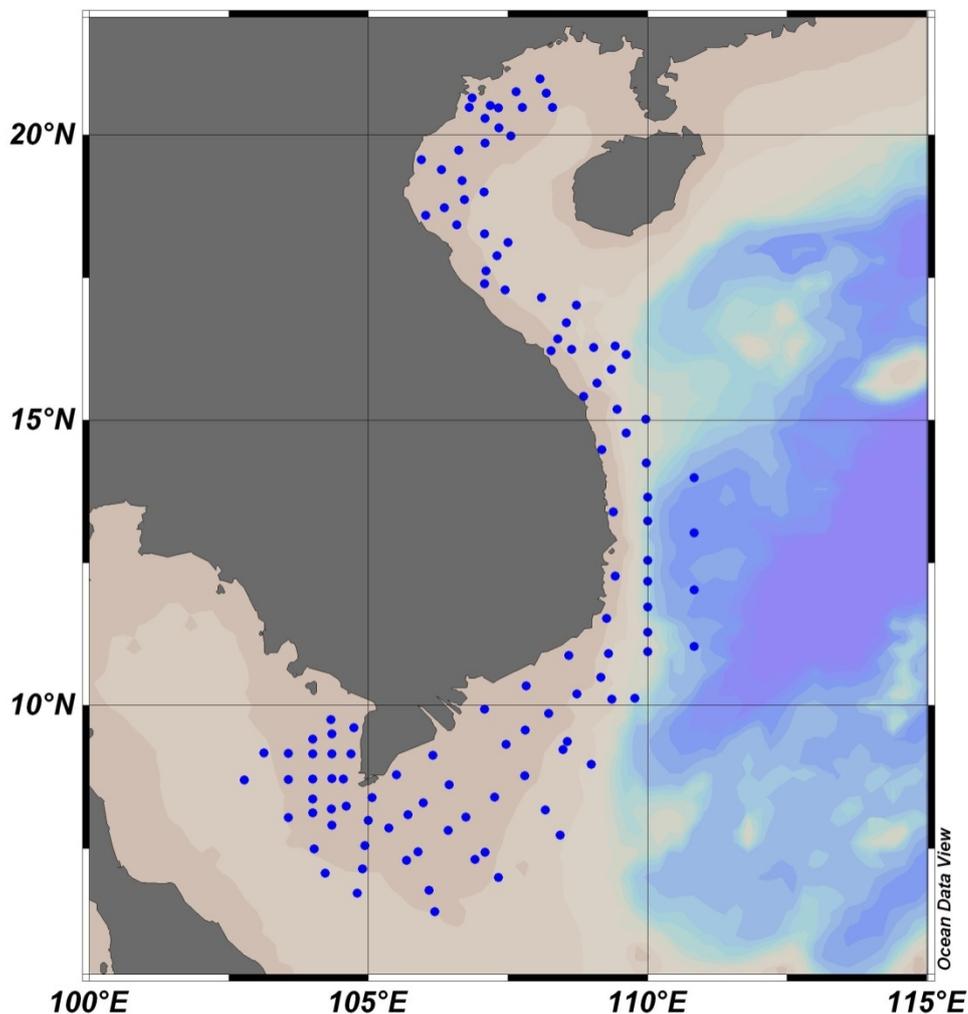

Figure 1 Map showing the survey stations.

The Neuston net was towed behind the ship for seven (7) minutes at the sea surface for collecting the juvenile fish samples (Figure 3). Vertical tow of zooplankton net (mesh size 330 $\mu$ m), phytoplankton net (mesh size 80 $\mu$ m), and larvae and egg net (mesh size 450 $\mu$ m) were

respectively operated with slow speed from the maximum depth of 100 meter to the sea surface (Figure 4). The volume of water filtered through the plankton net was measure through the flowmeter.

Thermosalinograph with Fluorometer (TSG-Fluorometer) which equips onboard M.V. SEAFDEC2 were operated along the cruise track to measure the temperature and chlorophyll a. The system was designed to pump water from approximately 5 meter below the sea surface continuously. The data were average every 6 second. Unfortunately, during M.V. SEAFDEC2 was en route to the survey station OS46 (June 9, 2012), the ship's gyrocompass system was failure and affected to the NMEA navigation device of the thermosalinograph system. Therefore, the data acquired from the thermosalinograph system were 44 tracks from the station OS01 to OS46 only.

**Figure 2.** Compact CTD data logger and current meter deployment.

**Figure 3.** Neuston net towing at the sea surface.

**Figure 4.** Vertical tow of zoo-phytoplankton net, and larvae and egg net.

## 6.2 Preliminary analysis of oceanographic parameters

All 121 oceanographic stations parted into five (5) legs conducted both day and night time with the sea depth varies between 10 m (OS107) and >2,000 m (OS45, OS52, OS53, OS57). However, the physical characteristics of Vietnamese waters of the present survey could not be described in the details in this report as the oceanographic data sharing and collaboration has become sensitive and unshared policy. Therefore, the only contour charts of sea surface temperature ( $^{\circ}\text{C}$ ), salinity (PSU), and fluorescence (mcg/L) were retrieved from the Thermosalinograph with Fluorometer and navigation logsheet. The contour chart along the survey tracks of salinity (PSU) and fluorescence (mcg/L) from the station OS01 to OS46 were shown in figure 5. The salinity varied between 21.9 to 33.3 PSU and low salinity was observed at the coastal area of station OS01, OS08, OS14 and OS20. The fluorescence intensity (mcg/L) found fluctuated between 0.0875 and 1.9 mcg/L at the inner Gulf of Tonkin (OS01 to OS11, OS14, OS20) while the outer area varied in the narrow range with the average at 0.0167 mcg/L.

The sea surface temperature retrieved from the Thermosalinograph (OS01 to OS46) varied between 27.5 and 31.9 °C parallel with the sea surface temperature recorded from navigation deck were varied between 24.0 and 33.3°C while the air temperature recorded between 26 and 37°C (Figure 6). The horizontal plot of sea surface temperature retrieved from the navigation logsheet show a cold water zone at offshore of Nha Trang area (OS53, OS54, OS57) and the southward region at the coastal area of station OS60 (Figure 6). The low sea surface temperature is fluctuated between 24.0°C and 25.6°C which is 2-4°C colder than the surrounding water (Figure 6). The survey result is evident of the upwelling over the southeast shelf of Vietnamese waters which may induce by the southwest monsoon forcing.

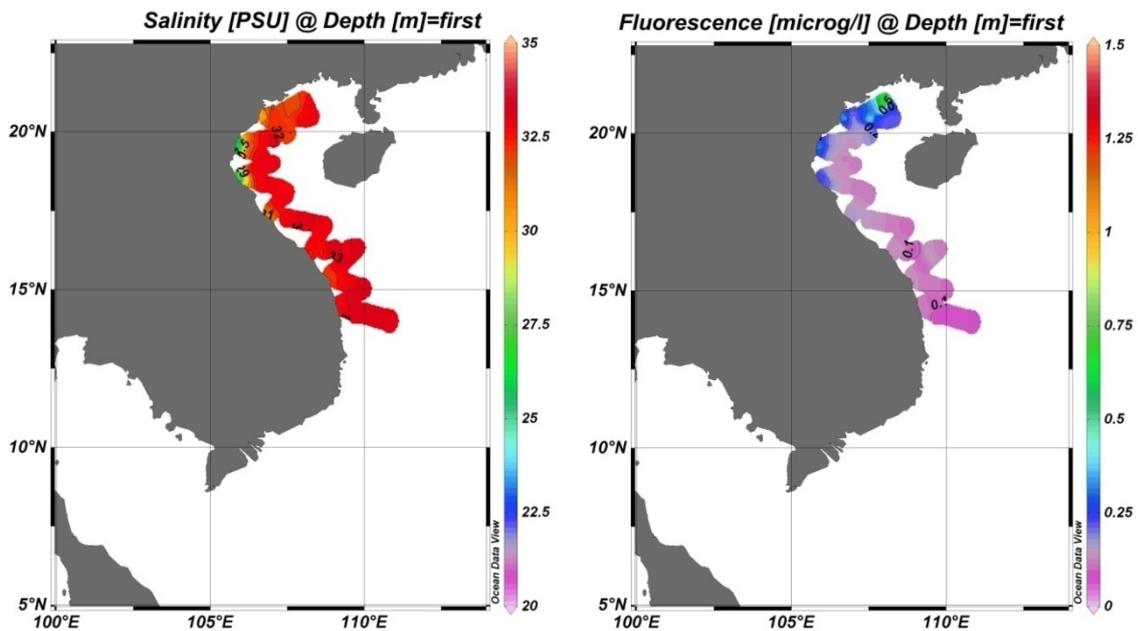

Figure 5. Horizontal plot along the survey track of salinity (PSU), and fluorescence (mcg/L).

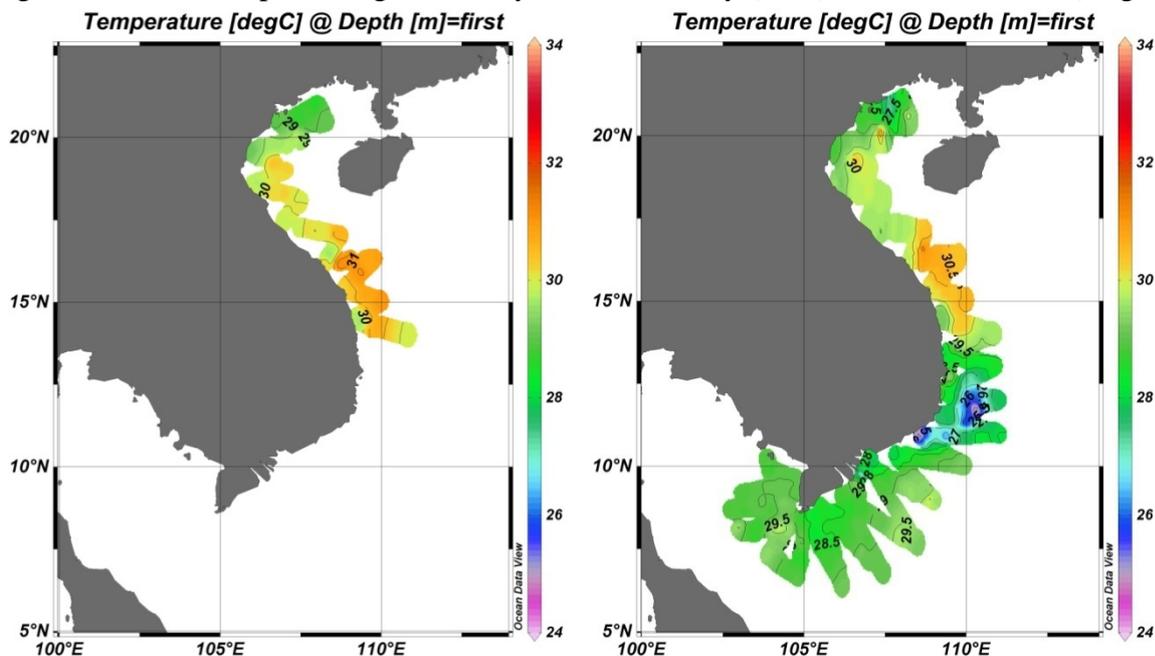

Figure 6. Horizontal plot along the survey track of sea temperature ( $^{\circ}\text{C}$ ) retrieved from the Thermosalonograph (left), and navigation logsheet (right) at the surf

## **7. Summarization of the activities conducted in the previous survey of M.V. SEAFDEC 2 in Vietnam water.**

The 1<sup>st</sup> survey of M.V. SEAFDEC2 in Vietnam water was conducted from 16 May to 24 July 2012. The activities and results of the survey can be summarized as the following.

a. Survey activities

- *Acoustic survey*

Based on the initial design for the assessment of fishery status, it was concluded that the total number of acoustic survey stations during the 1<sup>st</sup> cruise were sufficient. It was recommended for the 2<sup>nd</sup> survey cruise that the total number of the acoustic track will be the same with the 1<sup>st</sup> cruise.

However, it was found that in the water depth over 1,000m, the acoustic signal included the noise, especially in some area where there was no detection. In the coastal area (<10m), the noise was also recorded.

In terms of the quality, the record of acoustic data quality was generally good. However, the noise was included during bad weather condition and when the current indicator of the vessel was switched on. Therefore, it is recommended to change the cruising speed, and switch off the Current Indicator.

- *Oceanographic survey*

The number of oceanographic survey station was covered the whole station as planned. It is recommended that the oceanographic survey of the 2<sup>nd</sup> cruise will be the same as 1<sup>st</sup> cruise. However, oceanographic survey should not be in coastal area where the water depth is less than 10m. In addition, the oceanographic winch meter should be fixed before the next cruise.

- *Fishing gear operation*

Out of 120 total survey stations planned, it was only 57 and 12 stations of demersal and mid-water trawl samplings were conducted. The main reason was that sea condition was not suitable and safe enough for the trawl sampling. In addition, a number of problems had occurred during the survey cruise including net broken, DC system trouble, winches trouble. However, during the LEG-1, LEG-4, and LEG-5, the samples were sufficient for data analysis, whereas there were only few sampling stations for the LEG-2 and LEG-3.

It is strongly recommended that the station for trawl sampling should follow the original/agreed plan (at least 2 stations on each track). However, the trawl net should be already set during the acoustic track, and to be ready for sampling based on the signal of the fish school.

It was recognized during the 1<sup>st</sup> cruise that the height of the net mouth was quite low. This caused to limited amount of the samples for the acoustic survey analysis. To resolve this limitation for the next cruise, there are two (2) options recommended as follow:

Option 1: Using a new set of otter-board and trawl net

It is recommended that the high-mouth-opening trawl sampling net (similar to that of using in research study of SEAFDEC/MFRDMD, so-called crocodile net in Malaysia) and a set of 2-in-1 otterboard (which can be used for demersal and mid-water fishery resource survey should be used.

It was recognised that it was too dangerous to change of the otter-board at sea from/to demersal and midwater trawl sampling. For future smooth operation of the survey, it is therefore RIMF has requested TD to provide 2-in-1 otterboard which both demersal and midwater trawl could be used. In this regard, TD informed to RIMF that the cost for a set of the requested otterboard is approximately USD 20,000. In addition, RIMF also requested TD to provide high-mouth-opening trawl sampling net (similar to so-called crocodile net in Malaysia which SEAFDEC/MFRDMD is now conducting a research on) for obtaining better performance in fish sampling. In this connection, TD informed RIMF that the the high-mouth-opening trawl sampling net will cost about USD 12,000. In response to this request, TD could borrow the 2-in-1 otterboard from MFRDMD whereas the net have to be provided by RIMF's budget. The Meeting noted that time required for constructing the new net would be about 1 month.

Option 2: Using the trawl net of Vietnam

RIMF informed SEAFDEC that RIMF has a set of high-month-opening trawl sampling net, which has been used onboard R/V Bien Dong (2 nets and one pair of door). Therefore, this set can be used for the next survey by M.V.SEAFFDEC2. However, this matter should be carefully considered by experts from RIMF and SEAFDEC/TD about the possibility to use the net. If it is applicable, it is required to have trial before the survey.

The Meeting also noted that in case that these 2 options could not be finalized, the same trawl sampling nets using during the 1<sup>st</sup> cruise will also be used in the 2<sup>nd</sup> cruise.

b. Period of time.

Period of time was suitable for the 1<sup>st</sup> cruise, which can represent the data of stock status during southwest monsoon.

c. Weather condition.

It was noted that weather during the 1<sup>st</sup> cruise was too tough to carry out the research survey.

d. Port of call

At Hai Phong, it was originally planned to bring the vessel mooring at Hai Phong main port. But, the location of mooring had to change due to urgent security reason, which requested by port authorities.

In Phu Quoc, there is only domestic port available at An Thoi, and it has never used by foreign vessel.

e. Corporation between SEAFDEC/TD staff and RIMF staff onboard.

The number of problems that occurred during the 1<sup>st</sup> cruise was discussed and clarified for future smooth working among the both parties onboard the vessel.

**Research activities of M.V. SEAFDEC2**  
**Cruise 39-1/2012: Pelagic Fisheries resources survey in Vietnam Waters**

Date	Time	Activities	Remark
14 May 12	0845	Leaved SEAFDEC/TD for Hai Phong, Vietnam	
11 May	1155	Arrived Hai Phong Pilot station	
	1700	Alongside at port of Hai Phong	

**Sea trial: 24- 25 May 2012**

24 May 12	0700	All researcher RIMF (9 persons) embarked on board	
	0815	Leave Port of Hai Phong for cruise trial	
	1200	Let go anchor	L20°38'.00N λ106°52'.40E
	1430-2230	Calebration Hydro acoustic equipment EK 60	Sea depth 25 m
25 May 12	0615-0930	Calebration Hydro acoustic equipment EK 60	
	0940	Heave up anchor and then proceeded to Hai Phong	L04°47'.20N λ114°18'.20E
	1430	Alongside port of Hai Phong	L04°47'.30N λ114°18'.20E
	1540-1730	Preparation the fishing gear
