Abstract

Blood cockle is one of the major marine products in the community but the resource is encountering the risk of stocks degradation mainly due to destruction of the fisheries habitats from rampant illegal fishing by dredgers and over-exploitation. Considering this as a very critical issue, the Fisheries Administration of Cambodia and Community Fisheries Prey Nub 2 in collaboration with SEAFDEC agreed and established the Blood Cockle Refugia. Since the project supported by SEAFDEC ended in 2009, a research was conducted in 2014 to evaluate the effectiveness of the blood cockle refugia. The specific objectives of the study were to evaluate the current status of the refugia management and improve the blood cockle resources in the Community Fisheries. The study used quantitative approach to collect data including key informant interviews with key stakeholders such as fishers, fisheries officers and commune councils, focus group discussion and field observation. Documents from the Integrated Coastal Resources Management Project: Sihanouville, were reviewed. The report findings indicated that blood cockle refugia is still working under the guidance of the Provincial Fisheries Administration which modified the management approach. The regulation established on blood cockle size to be harvested was no longer enforced because local fishers complained about its negative impact on their daily catch. Other concerns of the Provincial Fisheries Administration included the relatively big proposed site for refugia which was difficult to manage; members of the Community Fisheries seemed not to be actively participating in the management scheme although the concerned local fisheries officers were working hard to implement the said scheme. Nevertheless, the daily catch of blood cockle was significantly stable indicating the effectiveness of the refugia. In general, the blood cockle refugia in Community Fisheries Prey Nub 2 brought a significant impact not only on blood cockle harvest but also on the habitats that this species rely on such as mangroves and sea grass beds that had been well protected. Anyhow, the management approaches of the refugia should be revised to reflect the socio-economic and environmental conditions of the local people in the area. Few suggested recommendations should be taken into account, such as (1) the restriction on size of blood cockle to be harvested should be modified, (2) the coverage area should be reduced, (3) the current Blood Cockle Team of the Community Fisheries should be restructured, and (4) a scientific research on blood cockle biology should be conducted using the baseline data from ICRM-SHV supported by SEAFDEC.

Keywords: blood cockle refugia, refugia management, effectiveness, community fisheries

Introduction

Blood cockle is one of the major marine products in Community Fisheries Prey Nub 2 in Shihanoukville, Cambodia but the resource has been observed to be at risk of degradation mainly due to destruction of the fisheries habitats from rampant illegal fishing by dredgers and over-exploitation. Considering this as a very critical issue, and in order to improve the situation, SEAFDEC together with the Fisheries Administration of Cambodia and the Community Fisheries Prey Nub 2, agreed and established the Blood Cockle Refugia. After the project supported by SEAFDEC was completed in 2009, a review was conducted in 2014 to evaluate the effectiveness of the blood cockle refugia. The specific objectives of the study were to evaluate the current status of the refugia management and promote the improvement of blood cockle resources in the Community Fisheries. Data for the review were collected through key informant interviews with key stakeholders such as fishers, fisheries officers and commune councils, focus group discussions, and field observations.

Results of Review

Findings from the review indicated that the blood cockle refugia is still working under the guidance of the Provincial Fisheries Administration with modifications of the management approach. Specifically, the specific regulation on size of blood cockle to be harvested which was adopted by the Blood Cockle Team during the Integrated Coastal Resource Management–Shihanoukville (ICRM-SHV) supported by SEAFDEC, was no longer enforced as the local fishers complained about the negative impact of such regulation on their daily catch. Moreover, the proposed site for the refugia was found to be relatively big and difficult to manage with some members of the Community Fisheries not actively participating in the management of the refugia. For such reasons, management of the refugia was placed under the Provincial Fisheries Administration with local fisheries officers taking up the responsibility of implementing the activity. Since then, the daily catch of blood cockle has been significantly stable indicating the effectiveness of the refugia.

Conclusion and Recommendations

In general, the management approaches of the blood cockle refugia should also be revised to reflect the socio-economic status of the local people and the environmental conditions in the refugia area. Few recommendations should be taken into account for the sustainability of the refugia. These could include modification of the regulation on the size of blood cockle to be harvested, reduction of the coverage area to facilitate effective management, restructuring of the current blood cockle team of the Community Fisheries, and conduct of a scientific research on blood cockle biology using the baseline data compiled from the ICRM-SHV Project. Furthermore, it should be considered that fish refugia could be effectively managed if illegal fishing activities especially by outsiders are eliminated. Activation of patrol work is important to help reduce illegal fishing in the refugia area. Community Fisheries should maintain close collaboration with the Fisheries Administration in combating illegal fishing activities, especially in enforcing the relevant laws and regulations.
