# CRUISE REPORT ON RESEARCH ACTIVITY M.V.SEAFDEC 2 Cruise No. 28-1/2008 <br> 3 March - 4 April 2008 

## Fishery Resources Survey in the Andaman Sea of Thailand

## TD/RP/117

This report is base on preliminary data
For readers who may need data in the report, please contact to:
Southeast Asian Fisheries Development Center
Training Department
PO. BOX 97 Phrasamutchedi
Samut Prakan, 10290
THAILAND
Tel: 662-4256100
Fax: 662-4256110
E-mail: td@seafdec.org

## I. Cruise summary

## Cruise no.: MV.SEAFDEC2 No.28-1/2008

Period: 3 March - 4 April 2008 (31 days)
Area: The Andaman Sea: Similan Island and the EEZ of Thai Waters

Port of call: Phuket, Thailand
Objective: 1) Whale sighting survey (during cruising between TD and Andaman
Sea)
2) Deployment of Tuna FADs (included fishing ground survey)
3) Fishing Trials on Deep Sea Beam Trawl and IKMT (after completion the main activities)

Main activity: 1) ACDP Mooring (upload) and re-deployment
2) Oceanographic survey by ICTD
3) Water samplings
4) Plankton survey by horizontal and vertical samplings
5) Sediment samplings from Box-Core, (alternative gears: Gravity core)
6) Biosonic experiments during the 1st Leg (option)

## II. List of personal on board

Ship personals

| No. | Name | Position |
| :---: | :--- | :---: |
| 1 | Mr. Tossaporn Sukhapindha | Captain |
| 2 | Mr. Veerachai Chettasumon | Chief engineer |
| 3 | Mr. Suren Pruksarat | Second officer |
| 4 | Mr. Somphote Vudthipanyo | Third officer |
| 5 | Mr. Komson Sangphuek | Second engineer |
| 6 | Mr. Somyos Pronprasert | Fishing Assistant |
| 7 | Mr. Anuruk Loog-on | Boatswain |
| 8 | Mr. Pradit Kui-prasert | Steerman |
| 9 | Mr. Tana Rungjoy | Steerman |
| 10 | Mr. Plew Shodok | Oiler |
| 11 | Mr. Boontarin Wara-in | " |
| 12 | Mr. Watchara Panasri | " |
| 13 | Mr. Saichol Kornnoom | Cook |
| 14 | Mr. Somsak Phangkumhuk | Ship's boy |

Researchers from SEAFDEC/TD ${ }^{1}{ }^{1}$ PMBC $^{2}$ and PSU ${ }^{3}$

| No. | Name | Responsibility | Period of duty |
| :---: | :---: | :---: | :---: |
| 1 | Mr. Sayan Promjinda ${ }^{1}$ | Chief scientist | 3-29/03/2008 |
| 2 | Ms. Natinee Sukramongkol ${ }^{1}$ | Researcher | 11-29/03/2008 |

## II. Research activities of M.V. SEAFDEC2

## Session I: 9 to 11 March 2008 <br> Deployment of Tuna FADs:

| Date | Time | Activities | Remark |
| :---: | :---: | :---: | :---: |
| 9 Mar 08 | 1615 | Leave Phuket for Tuna FADs setting areas |  |
| 10 Mar 08 | 0700 | Arrived area for setting Tuna FADs, |  |
|  | 0725-0830 | Setting Tuna FADs No. 1, depth 956 m | L08 ${ }^{\circ} 14^{\prime} .90 \mathrm{~N} \lambda 095^{\circ} 48^{\prime} .50 \mathrm{E}$ |
|  | 0940-1000 | Setting Tuna FADs No. 2, depth 948 m | L08 ${ }^{\circ} 14^{\prime} .90 \mathrm{~N} \lambda 095^{\circ} 48^{\prime} .70 \mathrm{E}$ |
|  | 1135-1145 | Setting Tuna FADs No. 3, depth 955 m | L08 ${ }^{\circ} 14^{\prime} .90 \mathrm{~N} \lambda 095^{\circ} 48^{\prime} .60 \mathrm{E}$ |
|  | 1200-1510 | Searching for FADs, the position of FADs <br> No. 2 L $08^{\circ} 15^{\prime} .20 \mathrm{~N} \lambda 095^{\circ} 48^{\prime} .30 \mathrm{E}$ <br> No. 3 L08 ${ }^{\circ} 15^{\prime} .20 \mathrm{~N} \lambda 095^{\circ} 48^{\prime} .40 \mathrm{E}$ |  |
|  | 1530 | Leave to Phuket |  |

Session II: 11-17 March 2008
Ocean - Reef Coupling:

| Date | Time | Activities | Remark |
| :---: | :---: | :---: | :---: |

## III. Fishing Activities and trials

## 1. Fish Aggregating Device (FAD) for the development of pelagic fishing ground in the Andaman Sea (in Thai)

## Objectives:

1) To study and collecting the fundamental data for fulfill the development of the tuna fishing ground (friendly to environment) in the Andaman Sea of Thailand
2) To study and developing the buoy and aggregating device for deep sea fishing ground
3) To extend the knowledge and techniques on FADs construction and installation to the technical staffs and concerns
4) To study and collecting the information on fish species included other marine life living in the fish aggregation device

### 1.1 Background:

The development of the pelagic fishing ground has been initiated in the Andaman Sea of Thailand as a consequence of the depletion of the tuna and other pelagic fishery resources in the Southeast Asian Region included the Indian Ocean and the Western Pacific Ocean due
to the heavy exploitation and over-fishing in those areas. The study on the developing of the pelagic fishing ground using the fish aggregation devices (FAD) in the areas those have potential had been initiated by the Fishery Engineering Section/ Capture Fishery Technology Division, SEAFDEC/TD. Three sets of FADs were constructed and installed in the EEZ Waters of the Andaman Sea of Thailand under the concept on environmental friendly fisheries. The interaction between the pelagic fishes and the aggregating device including the fishing ground condition were study in order to fulfill the development of the compatible buoy and aggregating device for deep sea fishing ground. Moreover, the contribution on the fishing technique on handline and/or pole and line included the technology on fish handling would also distribute to the local fishermen in the next process.

### 1.2 Materials and methods

## Iron FADs (capsule shape) construction

- Concrete buoy size $65 \times 65 \times 50 \mathrm{~cm}$ (211 liter) with a hoop made from the rubber tire (Figure 1a and 1b).
- Floating buoy (capsule shape as shown in figure 2) made from $1 / 4$ inch thickness metal with diameter 40 cm and total length 3 m . Two hoops attached to the lower part of buoy for connect to the main rope. Tiller was attached to the opposite side of the main.
- Polyurethane Styrofoam filled inside the floating buoy for maintain the buoyancy for long term submersion (Figure 3a and 3b).

Figure 1a

Figure 1b

Figure 2. Floating buoy diagram.

## Four strings FADs (נeщy-nisn snape) construction

- Round shape buoy diameter 15 cm for 80 pieces separated into 4 strings (20 buoys per line) interval 2 m between two buoys (Figure 4a and 4b).
- Galvanized iron size $1 / 2$ inches in round shape diameter 1 m for six pieces. Interval between each galvanized ring is 8 m for maintain the cylindrical shape after submersion.
- Polyethylene rope size 14 mm for tide the buoy.

Figure 4a

Figure 4b

- Tuft line (diameter 24 mm ) length 120 m attached to the buoy (Figure 5a and 5b).
- Bunch of tufts made from rope diameter 20 mm and length 2 m for 40 pieces.
- Distance between each tuft is 3 m to avoid entangle.

Figure 5a

Figure 5b

## Main rope

- Polyethylene rope size 24 mm (maximum tension 5,000 Kg-f) total length 900 m
- 120 m length will set for the tuft rope and 780 m for main rope.

## Installation

- Three sets of FADs were prepared for the present installation; there are 1 set of strings FADs (cylindrical shape) and 2 sets of Iron FADs (capsule shape) (Figure 6).
- The fishing ground for setting the FADs in the present study is between 900 and 950 m in the western of Andaman Sea of Thailand.
- The distance between each FADs is 150 m in triangle position.
- The FADs are submerging under the sea surface about 30-50 m depth.
- Combined the depth of the submerged FADs and the depth of the tuft lines, thus the actual depth of the FADs will be between 140 and 170 m .

## Observed buoy

- Due to the FADs are submerged at about 50 m depth under the sea surface thus, a single buoy (purse seine buoy were used in the present study) was tied to the FADs and left floating at the sea surface in order to made a convenient observation on FADs.

Figure 6. The installation.

### 1.3 Results

The first set of FADs (strings type) was setting on 10th March 2007 (0730) hrs at latitude $08^{\circ} 14^{\prime} \mathrm{N}$ and longitude $095^{\circ} 48^{\prime} \mathrm{E}$. The second set of FADs (capsule shape) at 150 m far from the position of strings type FADs. The third FADs (capsule shape) were set at 150 m as far as the first and the second FADs (Figure 7).

The observation activities were conducted in the first time during 27-30 March 2008 aboard M/V SEAFDEC 2. The observation had been made at the position of FADS number two (latitude $08^{\circ} 14^{\prime} \mathrm{N}$; longitude $095^{\circ} 48^{\prime} \mathrm{E}$ ) and found that the FAD was in the satisfied position and condition (Figure 7).

The checking on fish species was conduct using trawling lines and hand lines at the FADs setting area. The fish species caught during the observation are the dolphin fish, skipjack tuna, and juvenile yellowfin tuna (Figure 8). Moreover, there were fish schools at the FADs observed by eye.

### 1.4 Summary

- The first FAD setting (strings jelly-fish type) was unable to observed by hydro-acoustic equipment. However, considered of the water pressure resistant of the buoy.
- Among three setting FADs, the FAD number two (capsule shape) was in the best position.
- The position of those three FADs was easy to observe by the school of birds and fishes at the sea surface.
- Setting of the FADs in group may cause the trouble on setting the FADs as the first FAD those set against the current was unable to observed.
- Observation of FADs needed the skill on the using of the hydro-acoustic equipments and/or knowledge and training on using the hydro-acoustic equipments to the engineering staffs may useful to the results of the study.

Figure 7.

Figure 8.

## 2. Deep sea Beam trawl

### 2.1. Area of the sea trial

The fishing trial of beam trawl fishing operations, were conducted in western part of Phuket Island .Depth of the fishing ground sounded by echo sounder was between 80 m to 183 m . The position is viewed by the chart. ( Figure 9.)

Figure 9. The stations of deep sea fishing trial operation.

### 2.2. Beam trawl net for MV SEAFDEC2

SEAFDEC design of deep sea beam trawl gear and its net were developed and modified from the fisherman in the Northern part and Northeast of the European water. The design is suitable for M.V.SEAFDEC 2 and other research vessels for deep sea fauna samplings in particularly deep sea shrimps and bottom fishes.

Figure 2 shows the details of net. Head rope and ground ropes are made from Z-twist Polypropylene rope, diameter 12 mm . Length of head rope is 2 m . and ground rope length is 4.40 m . The wing parts and square part are made from polyethylene net, twine size $380 \mathrm{~d} / 21$ and mesh size is 38 mm . Belly part is composed from polyethylene net, twine size $380 \mathrm{~d} / 18$ mesh size is 38 mm and twine size 380d/18 mesh size 25 mm respectively. The cod end piece is made from polyethylene net, twine size $380 \mathrm{~d} / 18$ with mesh size 25 mm . There are not any lacing lines on the both side of net. Cover net at the cod end is made from polyethylene net, twine size $700 \mathrm{~d} / 30.44$ pieces of diameter 6 mm STT hoop sinkers are attached at the ground rope and tickler chains $9-10 \mathrm{~kg}$ in weight. Head line is attached with beam by tied cords. Chain matrices are rigged between the beam are 3.3 m in length and 9 mm of diameter.

Towing warp is duty heavy chains diameter $9 \mathrm{~mm}, 3 \mathrm{~m}$ length. Details of the deep sea beam trawl design, construction and chain arrangements and its operation are in Figure 3 and 5. The net of Beam trawl were designed and modified for two size of frame in 2 m . and 4 m . respectively (Figure 10-14).

### 2.3. Fishing operations

Four fishing operations had conducted during this fishing trial on 27 March 2008. Beam trawl fishing trials were conducted only in the daytime. Also shrimp species always bury themselves under the muddy in the daytime. So that daytime operations are the most appropriate period for fishing trial (Figure 15-16). Towing time of operations was 30 minute 1 hour. The second and third operations the underwater camera were attached at the beam for observe the sea bottom and the ground rope characteristic, so the towing time in second and third operations were only 30 minute for safety the equipment (Figure 17-19).

The towing line was released $1.5-2.5$ times of the sea depth. In the forth operation to released the warp $\sim 2.5$ time ( 450 m ) of sea depth (183m), in order to prevent the beam trawl to the rock bottom or coral caused damage of towing line in the forth operation. Shooting speed was 2 - 3 knots in every operations, high towing speed make the beam and
ground rope rise up at the surface of sea bottom. In case the sea bottom is rock and coral the towing speed should be reduce to $1.5-2$ knots, and be able to reduce the damage of the trawl net.

Figure 17. Install underwater camera at beam.

Figure 18. The picture from underwater camera, the trickle chain at sea bottom

Figure 19. The picture from underwater camera, the ski at sea bottom

### 2.4. Results of resource survey

Four operations of deep sea fishing trial were conducted in 2 zone of sea depth. First operation to third operation were performed in shallow area ( $60-85 \mathrm{~m}$ ) and in the forth operation to operated in deep sea area $(175-185 m)$. The towing time in first operation was so long for adjust the ship speed and the towing line suitably.

Table 1. Fishing information of beam trawl fishing trials.

| Op. <br> No | Ship <br> speed <br> (kt) | Towing <br> time | Sea <br> depth(m) | Warp <br> length <br> $\mathbf{( m )}$ | Total catch in <br> weight( $\mathbf{k g}$ ) | CPUE <br> (Kg/hr) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2.5 | 55 mn. | 73 | 200 | 6.72 | 7.33 |
| 2 | 2.0 | 30 mn. | 80 | 180 | 1.47 | 2.94 |
| 3 | 2.3 | 30 mn. | 82 | 140 | 1.27 | 2.54 |
| 4 | $2.7-3.8$ | $\sim 40 \mathrm{mn}$. | 183 | 450 | Was loosed | - |
|  | Total | 2.35 hrs. |  |  | 9.46 | 4.02 |

Total catch from 4 fishing operations, 2.35 hrs towing time, was 9.46 kilograms and CPUE was 4.02 kilograms per hour. The mostly of the samples were sea urchins and sea stars, some of fish sample from the family follow as Apogonidae, Lophiidae, Paralichthyidae, Synodontidae, Bothidae Nemipteridae: Synanceiidae, Batrachoididae, Pinguipedidae, Cephalopod, Shrimp and Crab (Figure 20).

Figure 20. Catches from the beam trawl fishing trials.

## 3. Isaacs-Kidd Mid-Water Trawl (IKMT)

### 3.1. Materials and methods

Isaacs-Kidd mid-water trawl (IKMT) is an oceanography tool used to collect bathypelagic biological specimens larger than those taken by standard plankton nets (Figure 21). The IKMT is a long, round net approximately 6.50 m long, with a series of hoops decreasing in size extending from the mouth of the net to the rear (cod) end, which measures an additional 2 m in length. The hoops maintain the shape of the net during towing. The mouth of the net is 1.75 m wide by 1.30 m high, and is attached to a V-shaped, rigid diving vane. The outer net of IKMT is PA multifilament $\varnothing 1 \mathrm{~mm}$, mesh side 75 mm and the inner net is PA multifilament (knotless) $\varnothing 0.5 \mathrm{~mm}$, mesh size 16 mm . Cod end part used the plankton net mesh size 1 mm and cover with PA multifilament $\varnothing 1 \mathrm{~mm}$, mesh side 19 mm net. All bridles are SST wire $\varnothing 8 \mathrm{~mm}$. The net spreader is iron $\varnothing 35 \mathrm{~mm}$ with approximately 1.50 m length.

The trial operations on Isaccs-Kidd Mid-Water Trawl (IKMT) were conducted for the living organisms collecting at the deep-scattering layer with towing speed between $1.8-3.3$ knots and approximated towing time of $30-60$ minute. To make sample collection easier, the IKMT is always used in conjunction with echo-sounders, which provide a target area for sampling. Partial details of IKMT operation are in table 2 and figure 22.

Table 2. Partial details of IKMT operation included the shooting position depth of capture and the scattering depth.

| Operation <br> No. | Latitude | Longitude | Depth of <br> capture $(\mathrm{m})$ | Remark |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $08^{\circ} \_34.96 \mathrm{~N}$ | $095^{\circ} \_50.47 \mathrm{E}$ | $25-30$ | Scattering layer $25-30 \mathrm{~m}$ |
| 2 | $08^{\circ} \_13.75 \mathrm{~N}$ | $095^{\circ} \_53.27 \mathrm{E}$ | 25 | Scattering layer $25-30 \mathrm{~m}$ |
| 3 | $08^{\circ} \_13.28 \mathrm{~N}$ | $095^{\circ} \_55.97 \mathrm{E}$ | 350 | Scattering layer $290-400 \mathrm{~m}$ |
| 4 | $08^{\circ} \_11.22 \mathrm{~N}$ | $096^{\circ} \_10.50 \mathrm{E}$ | $120-140$ | $19: 15$ Scattering layer 130 m <br> $19: 40$ Scattering layer $70-100 \mathrm{~m}$ |
| 5 | $07^{\circ} \_55.90 \mathrm{~N}$ | $097^{\circ} \_51.90 \mathrm{E}$ | 25 | $06: 30$ Scattering layer $10-30 \mathrm{~m}$ <br> $06: 40$ Scattering layer separate to <br> 2 layers |
| 6 | $07^{\circ} \_54.10 \mathrm{~N}$ | $097^{\circ} \_53.90 \mathrm{E}$ | 30 | Scattering layer $19-40 \mathrm{~m}$ |

Before start the operation, the essential information of weather and oceanographic condition are collected, in addition the target area and scattering layer could be detected by the scientific echo-sounder (Furuno FQ80) before and during the operation (see figure 23).

Thus, all of the acoustic equipments onboard that have the same or nearest frequency of scientific echo-sounder must be turn off to prevent the noise problem.

ISACCS- KIDD MIDWATER TRAWL

Figure 21. Diagram of Isaacs-Kidd mid-water trawl (IKMT)

### 3.2. Results

All sample that collected by IKMT were preserved with formalin $10 \%$ solution and some living organism in the scattering layer was shown in figure 24 .

Figure 22. Operation position of Isaccs-Kidd Midwater trawl (IKMT)

Figure 23. The target area and scattering layer were detected by the scientific echosounder (Furuno FQ80) before and during the operation

Figure 24. The sample active organism live in scattering layer

## IV. Oceanographic survey

There are 32 and 25 oceanographic stations conducted in leg I and leg II, respectively (Figure 25-26). Partial details of the survey and environmental condition of each station had shown in table 3 and 4 respectively. The materials and methods of the oceanographic survey were conduced as follow;

## Physical and chemical oceanography

The iCTD was deployed from the sea surface to approximately 5 meter above the sea bottom and the maximum depth of 400 meter at the station deeper than 500 meter. Physical and chemical characteristic of water including conductivity, temperature, depth, dissolved oxygen, pH , and PAR was measuring using SeaBird 911 CTD and Thermosalinograph with Fluorometer (TSG-Fluorometer). All iCTD
data were average into every 1 meter interval. Data in each station were divided into down cast and up cast (Figure 27-28).

Figure 25. Map of the oceanographic stations at the Similan Island on leg I.

Figure 26. Map of the oceanographic stations in the Andaman Sea on leg II.

TSG - Fluorometer were operated along the cruise track of M.V.SEAFDEC 2 to measure the temperature and chlorophyll a. The system was designed to pump water from approximately 5 meter below the sea surface continuously. The data were average every 6 second. Operating summary had shown in table 3.

During retrieving the iCTD, Carousel Water Sample comprised with the Niskin Bottles which is a part of CTD system were used for collecting water samples from standard depth (Table 3). The water sample was analyzed aboard on the dissolved oxygen, alkalinity, pH , and chlorophyll a. Another process such as nutrient and heavy metal in sea water was further process after bring back to the laboratory of PMBC and PSU.

## Biological oceanography

Marine biology was conducted on the zooplankton, phytoplankton and fish larval. The 45 cm diameter bongo frames were attached with the net mesh size of $1000 \mu \mathrm{~m}$ and $500 \mu \mathrm{~m}$, respectively. A flow meter was attached at the aperture of net to measure the water volume passing through the net. Bongo net was oblique tow with ship speed approximately 1-2 knots. Angle of towing cable was maintained at $45^{\circ}$. Towing depth was observed using Net SONDE (depth meter). Towing time for downward and upward was 15 minute each. The samples were preserved in 5\% buffered formalin and seawater immediately. Partial details of Bongo net operation are in table 3.

Fish larvae and juvenile was also collected using the Neuston net. The 75 cm long, square shape frame with net mesh size $1000 \mu \mathrm{~m}$. The operation was conducted after the bongo net operation with the towing time approximately 15 minute at the sea surface. The details of the Neuston net operation are in table 3.

## Preliminary analysis of oceanographic parameters

The profiles of temperature, salinity, dissolved oxygen and pH from the oceanographic stations were plotted and shown in figure 27 for leg I and in figure 28 for leg II. Data from each station had shown the similar pattern except the pH data. The vertical plotted of the temperature, salinity, and dissolved oxygen along the survey track of leg I and II were shown in figure 29 and 30.

Along the continental shelf stations (BVL operation), the surface temperature was found lower than the offshore stations. Those of dissolved oxygen concentration at station no. 2, 3 and 6 was also lower than others.

Figure 27. Profile of temperature ( ${ }^{\circ} \mathrm{C}$ ), salinity (psu), dissolved oxygen ( $\mathrm{ml} / \mathrm{l}$ ), and pH of oceanographic stations in leg I.

Figure 28. Profile of temperature ( ${ }^{\circ} \mathrm{C}$ ), salinity ( psu ), dissolved oxygen ( $\mathrm{ml} / \mathrm{l}$ ), and pH of oceanographic stations in leg II.

Figure 29. Vertical plot along the survey track at Similan Island of temperature $\left({ }^{\circ} \mathrm{c}\right)$, salinity and dissolved oxygen ( $\mathrm{ml} / \mathrm{l}$ ) at leg I.

Figure 30. Vertical plot along the survey track at Similan Island of temperature $\left({ }^{\circ} \mathrm{C}\right)$, salinity and dissolved oxygen ( $\mathrm{ml} / \mathrm{l}$ ) at leg II.
